

# Add support for [filehash] option #489

New issue

At the moment the output name options include `hash` (build hash) and `chunkhash` (hash of all files in a chunk), but is missing something like `filehash` so that each file in a chunk is uniquely hashed.

For example, when using the extract-text plugin, it adds CSS files to the chunks but the CSS and JS files in the chunk share the same hash, which is not optimal for caching purposes (maybe only your JS changes but then you've invalidated your CSS bundle too).

The problem with `[filehash]` for js chunks was that we need the hash before we have the content. The hash need to be part of the content (to get the urls for loading). But for the extracted chunk we should generate a different hash than for the js chunk.

`[contenthash]` was added for the css chunk.
